Abstract

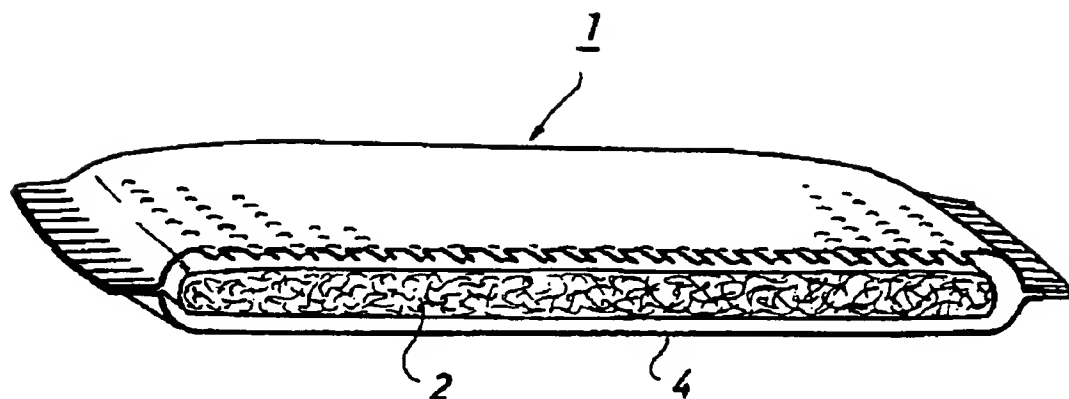

PURPOSE:To make a small hole for passing menstrual blood toward its adsorbent so as to be unseen from just the upside by making this hole being made in a surface material of a sanitary napkin so as to get only the one side opened sideward and to prevent the underside of parts other than an opening from being seen from the upper part by an inclined piece.

CONSTITUTION:An inclined piece 9, whose one side 7 is cut linearly and the remaining circumference 8 is formed into circular form, is formed in a polyethylene film 6 of 0.005mm or 0.04mm in thickness serving as a surface material for a sanitary napkin whereby an opening 10 is formed between the one side 7 and this inclined piece 9. In this surface material, its sight from just the upside is interrupted by the inclined piece 9, and since a state of the underside of the polyethylene film 6 can be unseen, menstrual blood adsorbed in its adsorbent 1 is also unseen. In addition, since the inclined piece 9 is tilted downward, the blood dropped on the film 6 is guide by the inclined piece 9, leading to the opening 10 upon running on it, and discharged to the backside of the film 6 from this opening, thus it is adsorbed in the adsorbent 1.
